Secure AI HR System

Hackathon Specifications

Event Objective

The Secure AI HR System hackathon challenges teams to act as startups: in 17 hours, they design and prototype an AI-agent solution that takes over the daily tasks of an HR team, then pitch it as a product to companies and HR departments. The solution must be intelligent, reliable and secure.

Problem Statement

HR teams are overloaded. Every day they receive many resumes and emails, and spend hours sorting, replying and following up instead of focusing on people. AI agents can do this work, but they read outside content (resumes, emails) and can act (send, rank, record). A useful solution must therefore be both smart and trustworthy.

Golden rule: the agent executes, the human decides about people.

Functional Axes

A dashboard presents the features of the solution. Each team may develop one or more features; the axes below are examples, and teams are free to propose their own:

- Resume Screening & Ranking
- Email Summary
- Automatic Replies
- Candidate Follow-ups
- Interview Scheduling
- Employee Questions

Expected Functional Outcomes

Resume Screening & Ranking

- Ranked shortlist of candidates against a job offer.
- Short justification for each candidate, based on job-related criteria only.

Email Summary

- Daily digest of the inbox, grouped by type and urgency.
- Flagging of the emails that need a human answer.

Automatic Replies

- Drafted replies to candidates, based on their own file only.
- Every reply approved by a human before it is sent.

Candidate Follow-ups & Interview Scheduling

- Reminders prepared for candidates who have not answered.
- Interview slots proposed from the recruiter’s calendar.

Employee Questions

- Answers to common questions (leave, policies) from company documents.

Solution Requirements

- Intelligent: outputs a recruiter can use as is (rankings, replies, summaries).
- Reliable: works end to end, on real volumes, without breaking.
- Human in the loop: nothing is sent or recorded without human approval.
- Security: AI security, system security, web application security, and related security aspects.

Technical Constraints

- Nothing is provided by the organizers: teams bring their own fictional data (resumes, job offers, emails). No real personal data.
- Teams are free to choose their models, frameworks and architecture.

Deliverables

- Source code and/or workflows.
- Technical documentation (README).
- Final presentation and demo (5 minutes).
